

ABSTRACT OF THE DISCLOSURE

A refastenable pant-like disposable undergarment for absorbing human discharge is disclosed. The undergarment includes a front panel, a back panel, and an absorbent assembly secured therebetween. The front and back panels are joined together to form a waist opening and a pair of leg openings. A pair of tear lines is formed in the front panel with each extending from the waist opening to one of the respective leg openings. A pair of attachment members is secured across the pair of tear lines and one side of the attachment members is removeably fastened to the front panel. The undergarment further includes a pair of ear flaps formed in the front panel under the pair of attachment members. Each ear flap extends to a portion of one of the pair of tear lines and is fixed to one of the attachment members. As the attachment members are opened, the pair of ear flaps will cause the pair of tear lines to break.
